

The Far-Field panel antennas by Laird are circularly polarized providing reception and transmission of signals in the 865-868 MHz frequency band. Laird's industry renowned design methodology achieves maximum efficiency and performance across the entire frequency band.

Both VSWR and axial ratios are excellent and allow the user to achieve the maximum performance for an antenna of this type. The antennas are housed in a heavy duty radome enclosure that can be directly wall mounted. An optional articulating mount allows either wall or mast mounting. The antennas are offered with an integrated coax pigtail and a variety of connector types are available.
